

## Coquitlam Scissor Lift Operator Certification

Coquitlam Scissor Lift Operator Certification - North American regulators suggest that worksites require operators of booms, scissor lifts or aerial work platforms to obtain certification training. Scissor lift operator certification is not mandatory, but there are advantages to ensuring that this training is provided to all the operators.

Scissor lift is a platform which vertically moves in order to allow staff to get to high levels. Scissor lifts are made along with a pantograph - linked, folding supports in an 'X' pattern. Upward movement takes place when pressure is applied to the outside of the lowest set of supports, propelling the work platform vertically by lengthening the 'X' pattern. A bridge extends from particular platforms in order to allow convenient access to the work place.

With the release of the manual valve, the platform could descend to the ground. The descension is done by simply releasing the pneumatic or hydraulic pressure. This is the main reason that scissor lifts are the best machine at worksites.

Both new and experienced operators could benefit from correct scissor lift training. This particular program can be tailored to focus specially on the particular equipment models at your worksite. The trainees' certificate of training would list the models of machinery on which they trained.

Included in the classroom instruction are the following subject matters: introduction to scissor lift training; attitude, rules and guidelines and authorization; safety regulations and common hazards; Occupational Health and Safety; workbook and record of training (or also referred to as ROT)

The end of the in-class section is finished with a written examination.

The following areas practical hands-on training and instruction consists of: pre-operational check; safety equipment;; function test checklist; operators handbook; regular maintenance and the practical session would end with a demonstration of proficiency.
